PROJECT:

Nearest Neighbor Queries with Location and Query Privacy:

Nearest neighbor queries are fundamental in location-based services, and secure nearest neighbor queries mainly focus on preserving the data confidentiality, query privacy and also effectively resists the collusion between the outsourced cloud server and the data owners or users. The previous big data system structure has changed because of the crowd-sensing data the terminals find it difficult to finish many safety operations due to computation and storage capability constraints. In light of the Multi Owners and Multi Users (MOMU) situation in the crowd-sensing data cloud environment presents a secure nearest neighbor query scheme based on the proxy server architecture, which is constructed by protocols of secure two-party computation.
